Checklist

☐ Establish the ALM at the onset and align it to the environments, source control, implementation methodology, and automation strategy.

☐ Ensure the ALM provides an efficient, reliable, robust, and automated mechanism to smoothly deploy the configurations and customizations across different environments, including peripheral solution components.

☐ Ensure ALM strategy enforces a source control-centric approach that enables creation of new environments with the latest configurations without the need to replicate existing environments.

☐ Use a build automation and CI/CD pipeline for the project.

☐ Consider the structure of the implementation team to enable effective collaboration while providing exclusive control to developers where needed.

☐ Follow documented best practices in general and specifically to each app.

☐ For Customer Engagement projects, download the whitepaper **Solution Lifecycle Management: Dynamics 365** for Customer Engagement and complete the self-assessment.
